

Administrivia.

- HW4 out (due 2/12)
- Midterm 1 tomorrow (2/9)
  - closed-book exam. everything about regular languages.
  - will be posted online at 12am / today midnight
  - submit before tomorrow midnight / 11:59pm
  - schedule 15-min oral exam w/ me.
- CS31 spring'21 looking for TAs!

- Verifying answers is easier than computing one...?

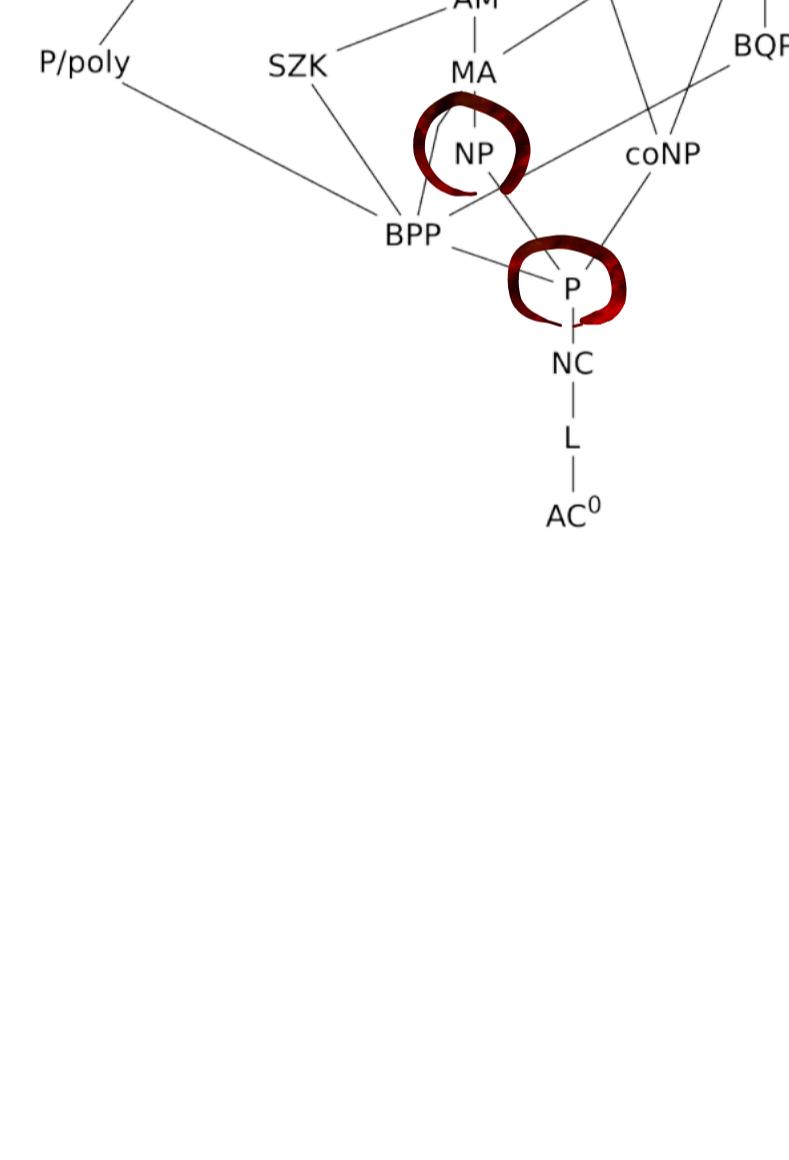

$P$  : problems that can be solved efficiently.

$NP$  : .. verified

$$\text{formally. } P = \bigcup_{k \geq 0} \text{TIME}[n^k]$$

$$NP = \bigcup_{k \geq 0} \text{NTIME}[n^k].$$

nondeterministic TM.

Open Question.  $P = NP$  ?

- It's ridiculous that it is open.

- encapsulate the idea of "creativity"

- Why nondeterminism = verification?

Def. Verifier  $V$  of language  $L$  is a Turing machine / algorithm,  
s.t.  $L = \{w \in \Sigma^* : V \text{ accepts } \langle w, \text{proof} \rangle \text{ for some proof } \in \Sigma^*\}$

Prop.  $L$  accepted by NTM in poly time iff  $L$  has verifier.

(sketch) " $\Leftarrow$ " : Use nondeterminism to guess the proof.

" $\Rightarrow$ " : Simulating NTM, make decision based on symbols in proof.  $\blacksquare$

Q. What's the next question?

- space complexity.
- EXP.
- why polynomial as def?
- is  $NP \cap \text{co}NP = P$ ?
